

## **ABSTRACT OF THE DISCLOSURE**

Exemplary embodiments of a fastening system include an object with a securement structure and a mounting structure fastened with respect to the securement structure. The fastening system further includes a bearing member with a first portion for bearing against the bearing surface of the securement structure and a second portion for bearing against the bearing surface of the mounting structure. The bearing member may be biased such that the bearing surfaces of the securement and mounting structures both simultaneously receive compressive force from the respective first and second portions of the bearing member.
